

UNIFIED TECH NEXUS

Game Builder AI

A multi-expert AI system for video game development — built by Nexus Studio

NEXUS STUDIO

Cotonou, Bénin

THE PROBLEM

Great game ideas die in production

1

Small teams can't match AAA production values

Specialized expertise across gameplay, art, and netcode is expensive to hire and slow to coordinate.

2

Generic AI coding tools miss game-specific judgment

They complete syntax — they don't reason about frame budgets, netcode risk, or player feel.

3

Studios in emerging markets are shut out further

Compute and tooling costs assume Silicon Valley budgets that most of the world doesn't have.

THE SOLUTION

One AI, several specialized experts

Game Builder AI is a Mixture-of-Experts-inspired system: instead of one generic model, specialized AI personas — each with deep domain rules and judgment — collaborate on a project the way a real studio team would.

Domain judgment, not autocomplete

Each expert enforces real engineering rules — performance trade-offs, netcode risk, scope discipline.

Model-agnostic orchestration

Runs on any capable LLM — no dependency on one vendor, no proprietary training required to start.

Built for constrained environments

Validated entirely on free-tier infrastructure — proof that applied AI doesn't require Silicon Valley budgets.

Six experts, one system

Gameplay Programmer is validated today. The other five are in active development, orchestrated through the same architecture.

Orchestration first, fine-tuning later

01

Specialized personas

Each expert is a rigorously defined rule set — not a generic prompt — enforcing real engineering discipline.

02

Model-agnostic orchestration

Personas run through openOPC, callable against any capable LLM — OpenRouter free tier today, fine-tuned models later.

03

Prove, then invest

We validate behavior on free infrastructure first. Real usage data — not assumptions — earns the case for training proprietary experts.

PROOF

Validated at \$0

No server. No cloud bill. No laptop. Game Builder AI's first expert was designed, tested, and iterated entirely from a phone, across two independent validation runs on free-tier language models.

\$0

INFRASTRUCTURE

100%

MOBILE-BUILT

2

VALIDATION RUNS

Free

LLM TIER ONLY

Rule-following improved measurably between runs: after tightening one behavioral rule, both models tested on the harder prompt stopped and asked for scope confirmation instead of over-generating code — exactly the target behavior.

AI-for-game-dev is early and moving fast

Engines are opening up

Unity retired its first-party AI in favor of third-party model support. Unreal Engine 5.8 ships an experimental MCP plugin for external AI. Neither is picking one exclusive AI partner — both are opening the door.

Capital is already moving

Comparable AI-for-gaming tools have raised at pre-seed and seed in 2025–2026, from focused QA agents to narrow personalization engines — validating appetite for specialized, not generic, tooling.

Narrow beats broad, early

The best-funded AI+gaming startup to date built its position on a single specialized capability before expanding — the same discipline behind Game Builder AI's expert-by-expert rollout.

Three paths to revenue

1

SaaS

Subscription and pay-per-use access for individual developers and small studios.

2

On-premise licensing

Deployed licenses for larger studios with data control and infrastructure requirements.

3

Data partnerships

Early access and elevated quotas for studios who contribute production data that sharpens future experts.

Built by one founder, fast

Daouda Abdoul Anzize

Founder — Nexus Studio

Based in Cotonou, Bénin. Over 100 public repositories in 16 months, spanning multi-agent orchestration, distributed systems, and applied AI tooling.

PRIOR RELEVANT WORK

weak-hardware-booster

Mobile game performance optimization on constrained hardware — direct precedent for the Performance Optimizer expert.

WHY THIS MATTERS

- Execution speed: a validated expert, shipped and iterated on, in weeks — not quarters.
- Resource discipline: built under real constraints, not idealized ones.
- Regional conviction: proof that world-class applied AI doesn't require Silicon Valley's budget or address.

Let's build together

Nexus Studio is looking for pilot studios, program partners, and early believers in applied AI built under real-world constraints.
